safe'ty-valve", 1 sēf'ti valv", 2 sīf'ty-vălv", *n* **1** An automatic valve on a steam-boiler which opens when the pressure reaches a certain predetermined point, permitting steam to escape, thus preventing the generation of dangerous pressures **2.** A similarly acting valve, admitting air from without so as to equalize internal and external pressures in a vessel in which there is a partial vacuum due to condensation

Of the three general types of safety-valves, the first, in which the valve is held against the pressure of the steam, simply by a weight, and known as the **dead-weight safety-valve,** is seldom used, except on low-pressure boilers The second type or **lever safety-valve** is extensively used on stationary boilers The stem of the valve engages with a lever of the third order a short distance from its pivoted extremity To the other end of the lever a weight is attached which may be set so as to cause the boiler to blow off at any desired pressure In the third or **spring** type, of which there are several varieties, a spring is sometimes used to take the place of the weight used with the lever-valve, but on a variety of much more extensive application the spring, in the form of a helix, acts directly upon the valve, which has a lift usually equal to one-fourth of its diameter This type is used extensively on stationary, but especially on marine and locomotive boilers *Locomotives have frequently* two safety-valves, one which is adjustable and another, termed a **lock-up valve,** which is set to open at a point somewhat higher than the first and is secured against *being tampered with by means of a lock or cover In the* **pop safety valve,** when the valve opens, the escaping steam acts upon a larger valve placed above the first, causing a sudden compression of the spring accompanied by a *pop,* a similar sound is produced when the valve closes The **Ramsbottom safety-valve** has two valves controlled by a single spring through the agency of a bar, one end of which is extended, forming a hand lever by which the adjustment of the valves may be ascertained The area of any safety-valve should be sufficient to carry off steam as fast as it can be generated under the best conditions altho such is seldom the case in practise, the area being governed usually by the amount of grate-surface and also in many districts by legal provisions

Kent's definition of *sale* is open to the criticism of including both barter and exchange Benjamin in his work on *Sales* (p 1) defines a sale as a transfer of the absolute or general property in a thing for a price in money" He specifies as the essentials of a valid sale, (1) parties competent to contract, (2) mutual assent, (3) a thing the absolute or general property in which is transferred from the buyer to the seller and (4) a price in money paid or promised **4.** Opportunity of selling, demand by purchasers, market, as, stocks find no *sale* [< AS *sala*, < *sellan*, sell]

The soul's new life begins at regeneration Its development in spiritual strength and stature is its *sanctification* FRANCIS L PATTON *Summary of Christian Doctrine* p 292 [F & P]

5. *Mus* (1) All the tones or notes of a key in regular ascending or descending order, in an octave or more.

Chromatic Scale

The octave is the basis of the scale of modern music, the hexachord was that of medieval and the tetrachord that of Greek music See illus under PENTATONIC SCALE

The **major scales** are the *scales of major keys, and the* **minor scales** the scales of minor keys The **diatonic scale** is a scale of diatonic or regular tones The **chromatic s.** includes the diatonic tones and chromatic tones or semitones of a key in regular ascending or descending order from key-tone to key-tone A scale may extend from any pitch of a key to its octave above or below, but its normal form is from key-tone to key-tone *Scale* is often incorrectly used as a synonym of *key* See KEY In the modern **major s,** when the tones are perfectly true the number of vibrations producing the respective tones are to each other, whatever the key may be in the following ratio

do re mi fa sol la si do
24 27 30 32 36 40 45 48

From this series of numbers, together with the data given under PITCH, the vibration-number of any note may be found Thus if middle C is given by 261 vibrations per second, the G above it which is *sol* when C is *do* is given $261 \times {}^{36}/_{24} = 391\frac{1}{2}$ Such an exact tonal ratio gives the **pure or just s** But these ratios are modified on keyed instruments by the necessity of using each key for several notes, very near each other, but not precisely the same, producing the **tempered s** The **minor s** has three forms, the intervals of which may be represented as follows, taking A for the keynote **original or oldest minor s,** A B – C D E – F G a, **harmonic minor s,** A B – C D E – F + G – a, and **melodic minor s,** A B – C D E F♯ G♯ – a (ascending), a G F – E D C – B A (descending),— the period indicating a whole step the dash a half step and the + sign a step and a half See TEMPERAMENT

Syn: pupil, student The primary sense of a *scholar* is one who is being schooled, thence the word passes to denote one who is apt in school work, and finally one who is thoroughly schooled, master of what the schools can teach an erudite, accomplished person when used without qualification the word is generally understood in this latter sense as, he is manifestly a *scholar*. *Pupil* signifies one under the close personal supervision or instruction of a teacher or tutor. Those under instruction in schools below the academic grade are technically and officially termed *pupils* The word *pupil* is uniformly so used in the Reports of the Commissioner of Education of the United States, but popular American usage prefers *scholar* in the original sense as, teachers and *scholars* enjoyed a holiday Those under instruction in Sunday-schools are uniformly designated as Sunday-school *scholars*. *Student* is applied to those in the higher grades or courses of study, as the academic, collegiate, scientific, etc *Student* suggests less proficiency than *scholar* in the highest sense, the *student* being one who is learning the *scholar* one who has learned On the other hand, *student* suggests less of personal supervision than *pupil* thus the college *student* often becomes the private *pupil* of some instructor in special studies For *disciple*, etc compare synonyms for ADHERENT — Ant.: dunce, fool, idiot, idler Ignoramus, illiterate person — **schol'ar-dom**, *n* [Rare] Scholars collectively, the academic world — **schol'ar-hood**, *n*

medieval doctors and universities, confined to no one school, but marked especially by its teaching of classical logic and philosophy as applied to theology and held in check by the assumption of the authority and rationality of theological dogma

The period of medieval scholasticism as a living force extended from about the middle of the 9th century to the 16th The earlier doctors were John Scotus Erigena of the 9th century, Lanfranc, Roscellinus, and Anselm of the 11th century, followed in the 12th century by Abelard, Gilbert of Poitiers, Peter Lombard, and John of Salisbury Up to the 13th century it was controlled largely by the Aristotelian logic and the Neo-Platonic philosophy after that it was marked by full adaptation of the Aristotelian philosophy In the 13th century scholasticism reached its height in Alexander of Hales Albertus Magnus, St Thomas Aquinas and Duns Scotus, all great and systematic thinkers At the close of this period the extension of philosophic investigation, the denial of the authority of dogma, and the break with church authority put an end to its development, and resulted in a theology independent of the Bible and often antagonistic to it Throughout all the scholastic period the doctrines of realism and nominalism were much discussed in connection with theological questions

sci'ence, 1 sai'ens, 2 si'ĕnç, *n* **1.** Knowledge gained and verified by exact observation and correct thinking, especially as methodically formulated and arranged in a rational system, also, the sum of universal knowledge

Science in the wide sense includes (1) **science proper**, embracing (*a*) exact knowledge of *facts* (historical or empirical science), (*b*) exact knowledge of *laws*, obtained by correlating facts (nomological science), and (*c*) exact knowledge of *proximate causes* (rational science), and (2) **philosophy**. See PHILOSOPHY In the narrow sense of positive science the word is used as including only the first two divisions of science proper

Science may be regarded as one vast miracle, whether we view it in relation to the Almighty Being by whom its objects and its laws were formed, or to the feeble intellect of man by which its depths have been sounded and its mysteries explored BREWSTER *Natural Magic* letter 1, p 94 [1832 1868]

2. Any department of knowledge in which the results of investigation have been worked out and systematized, an exact and systematic statement of knowledge concerning some subject or group of subjects, especially a system of ascertained facts and principles covering and attempting to give adequate expression to a great natural group or division of knowledge, as, the *sciences* of astronomy, botany, chemistry, and medicine

The sciences are divisible into (1) the **mathematical**, treating of quantity, (2) the **physical**, treating of matter and its properties, (3) the **biological**, treating of the phenomena of life, (4) the **anthropological**, treating of man, and (5) the **theological**, treating of the Deity See MATHEMATICS PHYSICAL SCIENCES, under PHYSICAL BIOLOGY, ANTHROPOLOGY THEOLOGICAL SCIENCE, under THEOLOGICAL

In the progress of human knowledge a science, in its earliest and simplest form, is usually a mere collection of observed facts, like the knowledge of the movements of the heavenly bodies possessed by the ancient Egyptians The next step is to correlate or generalize these facts forming a system like that of Ptolemy or Copernicus, the next, to formulate these generalizations as laws, as was done by Kepler the final step to proceed to some principle or force accounting for these laws, usually by the aid of mathematical analysis as was done by Newton in his theory of universal gravitation The tendency of modern physical science is toward this more complete generalization, its goal being the discovery of a principle that shall connect all physical phenomena Compare INDUCTIVE METHOD, under INDUCTIVE, also, LAW, 8

By *Science*, as the word is here used we mean a Systematic arrangement of the laws which God has established so far as they have been discovered of any department of human knowledge WAYLAND AND CHAPIN *Elements Polit Econ* p 4 [SH & CO]

Syn.: art, knowledge *Knowledge* of a single fact, not known as related to any other, or of many facts not known as having any mutual relations or as comprehended under any general law, does not reach the meaning of *science* *Science* is *knowledge* reduced to law and embodied in system The *knowledge* of various countries gathered by an observant traveler may be a heterogeneous medley of facts, which gain real value only when coordinated and arranged by the man of *science* *Art* always relates to something to be done, *science* to something to be known Not only must *art* be discriminated from *science*, but *art* in the industrial or mechanical sense must be distinguished from *art* in the esthetic sense the former aims chiefly at utility, the latter at beauty The mechanic *arts* are the province of the artisan, the esthetic or fine *arts* are the province of the artist all the industrial *arts*, as of weaving or printing arithmetic or navigation, are governed by exact rules *Art* in the highest esthetic sense, while it makes use of rules, transcends all rule, no rules can be given for the production of a painting like Raffael's "Transfiguration," a statue like the Apollo Belvedere, or a poem like the Iliad *Science* does not, like the mechanic *arts*, make production its direct aim, yet its possible productive application in the *arts* is a constant stimulus to scientific investigation the *science*, as in the case of chemistry or electricity is urged on to higher development by the demands of the *art*, while the *art* is perfected by the advance of the *science* Creative *art* seeking beauty for its own sake is closely akin to pure *science* seeking *knowledge* for its own sake Compare ART KNOWLEDGE — **absolute science**, definite knowledge of things as they actually exist — **abstract s**, theoretical knowledge pure science — **active s**, systematic knowledge put to practical use — **applied s**, that science which uses general principles to explain classes of actual phenomena — **controversial, disputatious, or eristic s**, logic as applied to the rules of debate — **domestic s**, the science of managing a house or household — **economic s**, same as ECONOMICS 1 — **exact s**, a science admitting of exact quantitative treatment, especially one of the mathematical or physical sciences —

The earliest attempts at sculpture are the rude carvings by paleolithic man The Egyptians were prolific sculptors and the schools of Memphis and Thebes are remarkable for their realistic portraiture Sculpture culminated in Greece in the various Attic schools connected with the names of Myron, Polycletus, Phidias, and Praxiteles In the early Christian centuries the art of sculpture suffered eclipse, but the classical tradition was revived by Pisano and Donatello Among moderns, Rodin exercises the most powerful influence, and claims Donatello as his master

3. The wax or wafer affixed to a document to be impressed, also, a disk of paper used for the same purpose, or a mere impression, scroll, or mark on the paper

The use of seals for authenticating or closing up documents dates from remote antiquity It has lately been held in England that neither wax, wafer, nor even an impression is necessary to the sealing of a deed, but only the use of something intended for a seal By a statute of the United States an impression directly on the paper is sufficient as a seal, wherever a seal is necessary In many States a scroll-seal is held to be valid even in the absence of a statute, and the tendency is by statute to render the use of seals unnecessary, except by corporations

sea'-ser"pent, 1 sī'-sûr'pent, 2 sē'-sĕr'pĕnt, *n* **1.** An animal, of snake-like form and monstrous size, believed by many to inhabit the ocean singly or in very limited numbers and varying much in general appearance according to the descriptions given
It has never been captured, although asserted to have been seen in repeated instances Some of the recorded credible observations of so-called sea-serpents apparently relate to well-known animals, as ribbon-fishes, basking sharks, etc A few zoologists believe that the animals seen by some observers are plesiosauri or other large marine reptiles generally supposed to be extinct
While with very few exceptions, all the so-called *sea-serpents* can be explained with reference to some well known animal or other natural object there is still a residuum sufficient to prevent modern zoologists from denying the possibility that some such creature may after all exist

seg"men-ta'tion, 1 seg'men-tē'shən, 2 sēğ'mĕn-tā'shon, *n* The act or of cutting or dividing into segments, or the state of being so cut or divided, specif, in biology, the cleavage of a cell, especially of the egg-cell or ovum, into parts similar to each other and to the parent-cell

The first step in the development of every individual plant or animal that arises from an egg consists in the division of the egg into two parts, each of which is a cell like the egg itself The two parts then divide in turn to form four, eight, sixteen, and so on in more or less regular progression until step by step, the egg has split up into the multitude of cells which build up the body of the embryo, and finally of the adult Segmentation of the egg was first observed in 1824, but its true meaning was not clearly perceived until twenty years after. Segmentation does not begin with the egg because the sperm-cell and the egg-cell arise by the division of cells preexisting in the body of the parent It is, therefore, derived by direct descent from an egg-cell of the foregoing generation, and the derivation so continues

In eggs containing little food-yolk the division is into approximately equal cells (holoblastic) In eggs containing much food-yolk the division is unequal (meroblastic)

Modern investigations show that segmentation is exactly comparable to the divisions of tissue-cells, being preceded by mitosis and connected with the processes of differentiation which is the most fundamental phenomenon in development Definite relations between the planes of division in the egg and structural axes in the adult sometimes appear in the earliest stages and suggest a more definite organization of the embryo at this time than is usually admitted Often the segmentation proceeds with a wonderful clock-like precision in a series which suggests that every division has a fixed relation to all that precedes and follows it **—protoplasmic segmentation** (*Biol*), the dividing of the protoplasm of the cell-body into segments, in contradistinction to the cleavage of the nucleus **—seg"men-ta'tion-cav"i-ty**, *n* The central hollow of the blastosphere **—s.-nucleus**, *n* The nucleus formed in the ovum by the union of its primitive nucleus with that of the spermatozoon (female and male pronuclei) **—s.-sphere**, *n* The spherical body that results from segmentation a blastula or morula

Waves of commotion have been investigated by means of the pendulum and the *seismometer* with tolerable accuracy in respect to their direction and total intensity HUMBOLDT *Cosmos* tr by E C Otté *Earthquakes* in vol 1, p 205 [LONDON 1859]

The instrument serves to record one linear component of the horizontal motion of the ground upon which it is installed When the whole seismograph is moved by the action of an earthquake, the freely suspended pendulum mass (*a*) tends to remain nearly or quite at rest with respect to horizontal motion in a direction at right angles to the line of the boom (*a b*) of the pendulum The relative motion of the ground and the steady mass is recorded on the clock-driven drum (*c*) covered with a smoked-paper record sheet, by means of the multiplying-lever (*d*)

DARWIN *Descent of Man* vol. i, p 59 [A. 1871.]

How far *natural selection* suffices for the production of species remains to be seen. Few can doubt that, if not the whole cause it is a very important factor in that operation and that it must play a great part in the sorting out of variations into those which are transitory and those which are permanent

The variations thus caused are preserved and accumulated by *sexual selection* which is in itself an extremely complex affair, depending as it does on ardor in love courage and the rivalry of the males and on the powers of perception taste and will, of the female. se-le'ni-um, 1 sı-lī'nı-um; 2 se-lē'ni-ŭm, *n Chem* A non-metallic element that is obtained as a dark-brown vitreous amorphous modification or as a lead-gray crystalline mass. It is prepared for commercial use chiefly from the by-products of sulfuric-acid manufacture in which seleniferous pyrites is burned, and is chemically similar to sulfur and tellurium, occurring in several allotropic forms. It is noteworthy for its variations of electrical resistance, which diminishes as the temperature increases, till the point of fusion is reached when, as the selenium becomes liquid, the resistance suddenly increases. The resistance of crystalline selenium is less in the light than in the dark a peculiarity that has given rise to many curious and ingenious applications, especially the transmission of photographs by telegraphy See SELENIUM CELL. PHOTOPHONE

The sensitiveness of *selenium* to light has been taken advantage of by Professor Barnard of Lick Observatory, who has employed it in a device for automatically detecting comets. FELIX L. OSWALD in *The Voice* [New York] June 4, 1891 p 10, col. 3

Self affixed to certain personal pronouns and pronominal adjectives gives forms that (1) express emphasis or distinction, as, I *myself* will go; you *yourself* did it; or (2) are used reflexively, as, he has hurt *himself*; I overslept *myself*. The so-called compound personal pronouns *myself*, *himself*, *herself*, etc., are used in both the nominative and objective cases.

Nouns and adjectives having the prefix *self-* may be classified under the following heads: (1) those having a directly reflexive force, as *self-estimation*, *self-control*, *self-murder*, etc.; (2) those implying that the action is accomplished without the aid of external agency, as *self-feeding*, *self-moving*, *self-registering*; (3) those which imply action not concerned about the self, and where a preposition would usually be required with the verb, as *self-absorption*, *self-conceit*. In the following list of self-explaining compounds the number after each word denotes the class to which it belongs. Compounds requiring definition will be found below or in vocabulary place. For respellings not given below, see the primitive words.

Syn.: self-control, self-denial, self-devotion, self-renunciation, self-sacrifice. *Self-control* is holding oneself within due limits in pleasures and duties, as in all things else; *self-denial*, the giving up of pleasures for the sake of duty. *Self-renunciation* surrenders conscious rights; *self-abnegation* forgets that there is anything to surrender. A mother will care for a sick child with complete *self-abnegation*, but without a thought of *self-denial*. *Self-devotion* is heart-consecration of self to a person or cause with readiness for any needed sacrifice. *Self-sacrifice* is the strongest and completest term of all and contemplates the gift of self as actually made. We speak of the *self-sacrifice* of Jesus, where any other term would be feeble or inappropriate.—*Ant.* self-gratification, self-indulgence, self-will.

The sensations, while not given to experience as simple and unmixed, are divided into classes by both naive and scientific analysis, in accordance with various principles of division Thus, according to the organ in whose excitation they originate, sensations of the eye, ear, skin, muscles, joints, etc , are distinguished, according to the purpose they serve in the perception of objects, they are called **visual, acoustic, kinesthetic, stereognostic,** etc , and according to the particular qualities of objects which they reveal, they may be classified as sensations of color, pitch, weight, motion, etc Modern experimental analysis has greatly increased the number of so-called simple sensations by distinguishing in the skin, for example, sensations of light-pressure, of heat, of cold, of pain and in the ear, sensations of pitch, of noise, and of equilibrium

A *sensation* is that peculiar modification of consciousness which is ordinarily developed on occasion of the excitement of some organ of sense by the action of external stimuli As distinguished from feelings which are subjective *sensations* are those peculiar modifications of our consciousness by which the nature of sensible objects is made known to us

The most important device in connection with this machine is the needle invented by Elias Howe (1846), the eye of which is near the point By this (in a double-thread machine) the thread is taken in a loop through the fabric to be sewed, then a bobbin, enclosed in a small shuttle, carries a thread through the loop, after which the needle (which punctures but does not pass through the fabric) is withdrawn by the upward action of the lever to which it is attached The fabric is then moved along a slight distance so as to be ready for another stitch Various kinds of stitches are made by different machines, as the *chain-stitch*, the *interwoven stitch*, and the *lock-stitch*, this last being the firmest and most desirable for enduring work

sex, *n* **1.** The physical difference between male and female animals, the character of being male or female, the possession of reproductive organs of a particular kind, differentiation in the functions of the reproductive organs Sex is the most nearly universal single feature of the animal kingdom In the lowest forms sex is absent, altho the objects of sex are attained by processes fundamentally similar to those in sexual reproduction Reproduction in animals possessing sex consists of the fusion of two reproductive or germ cells The male cell — the spermatozoon — is formed in the male reproductive organ, the testis, the female cell — the ovum — in the female reproductive organ, the ovary In order to bring about the union of these cells, *the external generative organs are often highly differentiated*, and this is accompanied by widely differing physiological and psychical characteristics Many animals are hermaphrodite, altho self-fertilization is the exception, and this condition has probably developed secondarily Analysis of the finer details of sexual reproduction shows that the ripe germ-cells of each sex contain exactly one-half the nuclear material normal to a body (somatic) cell of the individual, and that the fusion of spermatozoon with an ovum results in a cell, the nuclear matter of which is equivalent to the nuclear matter found in a somatic cell, but derived from two individuals Sex tends to bring about cross-fertilization, which, on the whole, seems to be an advantage to the race See HERMAPHRODITE, REPRODUCTION

In botany the term *sex* is by analogy applied to the differences in the reproductive organs of the higher plants The staminate organs which produce the pollen correspond to the male sexual organs in animals, the pistillate organs, which produce the ovule, correspond to the female sexual organs Hermaphroditism is common, the stamens and pistils occurring on a single flower (monœcious) in most plants, while the occurrence of pistillate flowers on one plant and of staminate flowers on another is rare (dicœcious)

2. Either of the groups into which organisms are thus divided; males or females of a group, collectively, especially, men or women **3.** Women in general, womankind as distinguished from man generally with the definite article, as, a devoted admirer of *the sex*

shal', } [A defective auxiliary (formerly also a transitive verb), having no participles, imperative, or infinitive] **1.** As an auxiliary verb (1) Am to, or are to expressing simple futurity now ordinarily used in this sense only in the first person (2) [SHALT, *2d per sing,* SHALL, *3d per sing & pl*] Art to, is to, or are to expressing subjection to a command, intention, constraint, obligation, promise, or permission

Shall is a word of authority and command It expresses no *sense of duty Thou shalt and thou shalt not are the language* of law-givers and commanders *Shall* is found 231 times in the Constitution of the United States and Amendments and will only three times and then is used indirectly S RAMSEY *The Eng Language and Eng Grammar* p 330 [8 P P 1892]

It had not occurred to them that civilization itself might engender the barbarians who *should* destroy it MACAULAY *Speeches, Re-election to Parliament* in vol II p 278 [T 1852]

Shall and *will* are used as auxiliaries in the simple future tense as follows I *shall* thou *will,* he *will,* we *shall,* you *will,* they *will* As auxiliaries expressing a determination, threat, command, or permission, their use is precisely the opposite as follows I *will* thou *shalt,* he *shall,* we *will,* you *shall* they *shall* The exceptions are numerous, and the distinction between the two forms constitutes one of the most difficult things in the language for the foreigner to master For instance, the form of the absolute future may be chosen to express determination in a prophetic way, as, you *will* rue this On the other hand, the imperative form may be used in foretelling to imply a wish or an opinion of the speaker, as, they *shall* all get their deserts In interrogations the form required in the answer is sometimes adopted in the query as, *Shall* you not come to see us? I hope I *shall* In the potential or conditional mode *shall* and *should* express simple futurity, as, *should* he come if we *shall* ever learn, whoever *shall* get her will have a treasure, as soon as you *shall* find out In indirect discourse, *shall* may be used as well as *will* when the idea of volition or control attaches to the second or third person as, he told me that he *should* do it, they write that they *will* come *Should* has also certain meanings independent of its relations as the imperfect of *shall*
